

BLOCKCHAIN TECHNOLOGY

PROJECT PROPOSAL

SUPPLY CHAIN TRACKING

Capital University of Science & Technology, Islamabad**

This project proposes the development of a Blockchain-Based Supply Chain Tracking System by the group members Saad Ayaz, Muhammad Saad Rafique, and Syed Yawar Abbas using HTML, CSS, JavaScript, Python, and Hyperledger Fabric.

The aim of this project is to provide a secure, transparent, and reliable way to track products as they move through different stages of the supply chain. Traditional supply chain systems often suffer from issues such as lack of transparency, data tampering, fraud, and difficulty in tracking product history, which reduces trust among stakeholders.

To solve these problems, this system will assign a unique ID to each product and record every movement of that product on a blockchain ledger. The system will be a web-based application in which the admin can add new products, supply chain members can update product location and status, and customers can track the complete history of a product using its unique ID. Since the data will be stored on Hyperledger Fabric, it will be secure, tamper-proof, and immutable. The frontend of the system will be developed using HTML, CSS, and JavaScript, while Python will be used for backend processing and blockchain interaction.

The expected outcome of this project is a secure and transparent supply chain system that reduces fraud, improves tracking accuracy, and increases customer trust. This project demonstrates the practical application of blockchain technology in solving real-world supply chain problems.
